

Argus

Your 2-minute demo script — friendly walkthrough

Total run time ≈ 2 minutes · read it warmly, like you're showing a friend. Text in *grey italics* is what you *do* on screen; the rest is what you say.

Intro · 0:00 – 0:20

Smile, app not open yet.

"Hi! This is **Argus**. Here's a problem almost every business has without knowing it: they **overpay their bills**. A discount they negotiated never gets applied. An invoice quietly charges more than the purchase order said. The tax is a little too high. Each one's small, nobody checks, and the money just... leaks out. Argus reads all that paperwork and **catches the money you're losing**. Let me show you."

1 · The pile nobody checks · 0:20 – 0:35

Open the app (`http://localhost:8000/argus/` — from the hub: `uvicorn serve:app --port 8000`).

"I've given Argus a normal stack of documents — a contract, a purchase order, and a few invoices from a vendor called ACME. Normally a person would have to read every line and compare them by hand. Nobody does. Argus does it in seconds."

2 · The number that matters · 0:35 – 1:20 the moment

Point at the big red headline.

"And right away — **\$5,300** in leakage, across three issues. Let's look. **First:** the contract promised a \$2,400 early-payment credit — the invoice applied **zero**. That's \$2,400 they were owed and never got. **Second:** the purchase order said \$10,000, but the invoice billed **\$12,000** — two thousand dollars extra. **Third:** the contract set the tax at \$1,000, the invoice charged **\$1,900** — nine hundred too much. Every one shows **which document, and the date** — so it's ready to hand to your finance team."

3 · Why it's trustworthy · 1:20 – 1:40

Tap one of the cards.

"It's not guessing. It only flags a real conflict — the same charge, two sources, two different numbers — and it puts an exact dollar figure on each. No hallucinated advice, just 'here are the receipts, here's the gap.'"

Outro · 1:40 – 2:00

Back to camera.

"And it runs **on my own laptop** — offline, private, no accounts. It's built on the same contradiction engine as Crosscheck, just pointed at your money. So that's Argus: it reads your contracts and invoices, finds where they **disagree**, and tells you **exactly how much you're losing**. Thanks for watching!"

Quick tips while filming

- Let the big **\$5,300** land first — that's the hook. Then walk the three cards.
- Say the everyday version ("a discount that never got applied"), not the jargon.
- The findings are cached, so the page loads instantly — no waiting on camera.
- One line if asked "how?": same engine as Crosscheck — it catches two sources disagreeing, and here it adds the dollar amount.
